WEEK 11 · PRODUCT MANAGEMENT

WorkRadar

AI Workflow & Implementation Notes / v1.0

GOAL
Use AI assistance to plan and build a manager-focused work overview while keeping assumptions, limitations, and human decisions visible.

IMPLEMENTATION APPROACH
A self-contained HTML/CSS/JavaScript prototype with seeded mock data; no backend or external integrations.

01 AI tools used

Tool	Use in this project	Boundary
ChatGPT (OpenAI)	Drafted the PRD structure, product scope, UX information hierarchy, mock work items, UI code, and documentation.	AI assistance does not imply live AI inference inside the prototype.
Python / ReportLab	Generated the formatted PRD PDF and AI Workflow PDF.	Document production utility; not an AI model.
Browser / JavaScript syntax check	Prepared a self-contained prototype and checked JavaScript syntax with Node.js.	Syntax checking is not a full browser QA or user test.

02 Significant prompts / instructions

Product framing: “Build WorkRadar, a manager-facing application that consolidates top work for the day, what happened, urgent attention items, and blocked teammates. Produce a PRD with target users, personas, journey, pain points, metrics, MVP scope, assumptions, and must-have versus nice-to-have features.”

UX & interface: “Design a high-fidelity, responsive manager workspace with Dashboard, Priority Feed, Item Details, Search, and Empty/Error State. Use a consistent visual system, clear hierarchy, and practical manager actions.”

MVP behavior: “Implement the dashboard, AI-generated summary, priority feed, search, detail view, and Assign / Mark Done / Snooze. Mock data is acceptable. Keep the prototype self-contained and disclose the lack of live integrations.”

03 What AI generated or assisted with

- A first-pass PRD structure, proposed success metrics, scope boundaries, assumptions, and acceptance criteria.
- UI layout, responsive CSS styling, mock tasks/team data, priority and status labels, and navigation structure.
- JavaScript interaction logic for search, filters, item details, assignment, completion, snoozing, and notifications.
- Initial README content and the layout/content for the two project PDFs.

04 What was manually reviewed, specified, or refined

- Mapped the deliverables to the six-step assignment checklist and kept the PRD within the two-page limit.
- Defined the product’s core manager workflow and the specific acceptance criteria for the required screens and actions.
- Made the AI boundary explicit: the displayed summary is deterministic synthesis over mock data, not a live LLM response.
- Included clear limitations and future-work items instead of claiming that external integrations, persistent storage, or production AI exist.
- Ran a JavaScript syntax check. This is not a substitute for a full browser, accessibility, or usability test; the final owner should run the prototype and verify every action before submission.

Prepared by: Santhosh Sankaran | **Version:** 1.0
Disclosure note: this document describes the current prototype and assistance used to create it. Update it if additional tools, human edits, or real AI services are added later.
