WEEK 11 · PRODUCT MANAGEMENT

WorkRadar

Product Requirements Document / MVP v1.0

THE PRODUCT	CORE PROMISE
One manager-ready view of team work, risks, and blockers—without manually checking every tool.	Know what matters today, what changed, what needs action, and who is stuck.

01 Problem statement

Managers often assemble a daily picture of team progress by checking project trackers, chat threads, code activity, and email separately. This fragmented workflow makes important changes easy to miss, creates context-switching overhead, and delays action on urgent work or blocked teammates. **WorkRadar consolidates the signals into a single, prioritized daily workspace** so managers can decide what to do next quickly.

02 Target users & personas

PRIMARY · TEAM MANAGER	SECONDARY · PROJECT / DELIVERY LEAD
Owns delivery across 5–12 people; starts the day by checking several tools; needs a reliable view of deadlines, ownership, and risks.	Coordinates cross-functional work; needs to spot dependencies, overdue items, and stalled handoffs before a delivery slips.
Job to be done: “Help me identify today’s highest-impact actions without reconstructing the whole team’s status.”	**Job to be done:** “Show me what changed and what is blocked so I can unblock the right person.”

03 User journey

1 · OPEN	2 · SCAN	3 · PRIORITIZE	4 · ACT
See team pulse	Read daily AI summary	Review risks & blockers	Assign, complete, snooze

04 Key pain points

Fragmented context	Low signal-to-noise	Unclear ownership
Status is spread across tools and threads.	Managers manually separate routine updates from urgent exceptions.	Blockers and next actions can lack a clear owner or follow-up.

PRODUCT PRINCIPLE **Prioritize clarity and action over showing every possible activity. Every surfaced item should explain why it matters and what the manager can do next.**

Scope & success criteria

A focused MVP for fast daily triage—not a replacement for the team's source-of-truth tools.

05 Success metrics

METRIC	MVP TARGET	WHY IT MATTERS
Time to daily team understanding	≤ 2 minutes in usability test	Tests whether the consolidated view reduces status-gathering effort.
Priority discovery	User identifies top 3 items correctly	Measures whether urgency and importance are legible.
Action completion	≥ 80% of test users complete an action without help	Validates usability of Assign / Mark Done / Snooze.
Blocker visibility	All seeded blockers visible in feed or details	Ensures known risks are not hidden in the interface.

06 MVP scope

MUST-HAVE · MVP	NICE-TO-HAVE · LATER
• Dashboard: today's top work, recent changes, team status • AI-generated daily summary grounded in displayed mock data • Priority feed with urgency, owner, status, and blocker cues • Search across seeded work items • Item detail view with context, owner, due date, and next step • Assign to a teammate; Mark Done; Snooze for later • Empty, loading, and error states; responsive layout	• Live integrations with Slack, Jira, GitHub, and email • Authentication, roles, and team-level permissions • Configurable priority rules and notification preferences • Historical trends, workload balancing, and team analytics • Feedback loop to improve summary relevance • Audit trail and integration health monitoring

07 Assumptions & constraints

- The first release uses realistic mock data; external integrations and a production backend are out of scope.
- The AI summary is a decision-support aid, not an autonomous decision-maker. It should be traceable to visible work items and clearly distinguish known facts from inferred risk.
- Managers need a quick scan first, with details available on demand; the interface should work on desktop and remain usable on smaller screens.
- MVP success targets are hypotheses to validate with usability testing, not claims of measured performance.

08 Product decisions & acceptance criteria

- A manager can identify the top work, what changed today, urgent attention items, and blocked people from the dashboard without navigating to other tools.
- Search returns relevant seeded items and opens the selected item's detail view.
- Assign updates the displayed owner; Mark Done updates the status; Snooze removes or deprioritizes the item for the chosen period in the demo state.
- The summary and priority feed update consistently after actions, or clearly communicate when content is based on a fixed mock snapshot.
- Empty and error states explain what happened and provide a useful recovery path.
